

an elongated handle member having a proximal end attached near one end of said tubular member which forms said apex and extending in spaced parallel relationship therewith toward a free distal end which may be inserted into said golf bag for said removable engagement of said apparatus with said golf bag and allowing said apparatus, with said selected golf clubs inserted into said tubular members, to be carried by said handle and laid on the ground so that said two tubular members which form said base support said apparatus on the ground, said handle member also being telescopically extendable from a retracted position of a length substantially the same as said tubular members to a extended position of a length substantially the same as shafts of said selected golf clubs allowing said apparatus and said selected golf clubs carried thereby to be supported by said handle and the ends of said selected golf clubs in a vertical disposition.

Claim 6. (previously presented) Apparatus removably engageable with a golf bag for holding and carrying selected golf clubs from said golf bag, said apparatus comprising:

three tubular members substantially shorter than any golf clubs to be carried thereby and joined together in parallel relationship, opened at each end and through which the shafts of said selected golf clubs may be inserted, said tubular members, in cross-section, being arranged in triangular relationship, two forming a base and one the apex of said apparatus, said tubular members being joined by interconnecting webs forming elongated recesses therebetween, at least one of said recesses being provided with one or more holders in which one or more golf balls may be removably carried; and
